

SENIOR ENGINEER CHALLENGE

For the senior AI engineer test, we are providing you with 2 use cases. For each of these use cases, we want you to make a presentation on how you would solve them with Machine Learning. For one of the use cases (that you can choose), we also want you to do the implementation and come up with a basic solution. The solution does not have to be perfect, but should show how you would implement your idea. Also think about how deployment could create value for a specific customer or industry.

Use case 1 - Clustering sensor data

At Customer A, data is being gathered of 20 sensors on a certain machine. So far we have seen 1600 breakdowns of the machine. Experts have manually labeled 40 of these breakdowns into different reasons and now we want to use these labels to say something meaningful about the 1560 other data points. Can you use clustering in combination with the 40 labels to group the data points?

Use case 2 - Sports analytics

Customer B has gathered video data of soccer games. They now want to use it to do some analytics. One of the ideas is to check how many players per team are on the screen at the same time. Can you help customer B with Machine Learning?

ML6

What will the interview look like?

- Quick round table for everyone to introduce themselves
- Your presentation (max. 25 minutes) in English, in chosen format
- Q&A
